

Part-2: Unleashing the power of Amazon ECS for platform teams
Additional features which can be used along with ECS and Fargate

Various types of Abstraction:

Account as a service

What is Account as a Service?

Application teams ...

... operate the application and the infrastructure

... have access to the AWS APIs

... create landing zones for each application team or workload

... restrict access to AWS APIs through control policies

Platform teams ...

Is Account as a Service right for me?

Developers have full autonomy

Supports a wide range of workload types

Full isolation between teams and workloads

Easy to attribute costs to workloads

Unable to standardize architectures and tools

Application teams have to take on the cognitive load of learning and operating the infrastructure

Platform as a service

What is Platform as a Service?

Application teams ...

... focus on building their applications

... have limited access or knowledge of where their workload is running

... build and operate the platform

... expose a limited number of supported workloads

Platform teams ...
